

# US-Based Private Healthcare Provider

## The Challenge

A large US based healthcare provider with both location specific (ward layout) and procedural learning (patient transfer) use cases. They required a VR self-authoring solution that can create 360 degree imagery based content as well as 3D simulations.

## The Actions

They used Facilitate's multi modality creator tools to address both use cases:

- 360 Scenario creator for their ward tours and hospital campus orientation.
- Microsimulations for their patient transfer and bedside procedures

## The Result

- Multi modality VR content creation is now an internal capability.
- The content created is VR headset and PC compatible.
- No reliance on outsourced agencies - creation is in-house, specific to them and scalable to other use cases.
