

## Scrape Local Business Data

**Client:** A neighborhood based mobile-centric marketplace for the borrowing and lending of goods and services

**Challenge:**

[Crawling](#) 10-20 sites per month and furnish data to help build database of items/services with relevant information. Also includes database building for car-sharing services. The level of information here is macro: name, photo, owner name, location (Lat. & Long.), price etc. Specific geographical targeting demanded.

**The Solution:**

Part of the regular [site-specific crawling](#), we ran slow crawls in sites to get the data according to fields. Slow crawl helped get data for this case smoothly.

**Benefits to the client:**

- Building a [crawl and extraction](#) process setup a continuous stream of data
- Helped aggregate content from many sites to enhance client site
- Zero data processing efforts at client's end
- Scalable infrastructure reduced client's costs
