

Marcura launches MarDocs with the use of XaitPorter

In line with its commitment to respond to the needs of its customers in the maritime industry, [Marcura](#) recently launched MarDocs, a collaborative cloud-based tool for charterers and brokers to manage fixtures. In order to improve the efficiency, security and control of the fixture contracts in the new system, Marcura partnered with Xait, the software development company behind XaitPorter, an Application-Platform-as-a-Service (aPaaS).

MarDocs completely changes the way a broker and charterer engage in agreeing or amending fixtures, removing the need for 'as per last'. Further, MarDocs is designed to remove time-consuming and repetitive tasks whilst delivering a solution that reduces risk and cost.

“ With MarDocs, we have created a solution that solves the industry's need for automating the creation of charter party documentation. We believe that by using XaitPorter as part of our solution, we have substantially sped up our time-to-market, allowing us to quickly launch a solution that the industry has needed for a long period of time.

— Adrian Challinor, the MarDocs Product Director

“ We are very pleased to work with a professional organisation such as Marcura, and that they have chosen Xait and XaitPorter. This is also an important step for Xait, as Marcura is our first client with a commercialized solution using XaitPorter as an aPaaS.

— Kris Sæther, Chief Commercial Officer of Xait
