

Maxillantas web and mobile app

Maxillantas is a Panamanian company that offers maintenance services to vehicle fleets for their tires, they specialize in cold retreading and their premise was to offer a budget-friendly and quality alternative to transporters in the country.

The company required a web application to automate the vehicle fleet review process, have real-time inspection reports so the customer can visualize their service results, solidify their database with classified clients and all the inspections results. This requirement was taken since everything was done manually with a lot of lost information and their clients were unaware of the true function of these inspections, they did not have total control or could organize the appointments in a productive way, not giving a personalized service to their customers.

To automate the processes in Maxillantas, we decided to use the Drupal 7 platform and the main Views, Rules and Web services modules, with the additional support of an Android application.

Client

Maxillantas

Project information

Case highlight

- Web application development synchronized to a mobile development (android)
- Traffic light reports development that provides the current state of the tires
- Administrative reports of customer fleets
