

CASE STUDY: Portal Migration

Vestas

CHALLENGE

Vestas had an old legacy Bex Web query portal where all users could access reports. As the portal was becoming outdated, they wanted to overhaul the organization's reporting infrastructure, transitioning from an outdated system to a more robust and flexible platform.

They wanted to have their reports migrated to the modern SAC Analytics Cloud Environment which they were already using for other purposes.

Vestas needed help and guidance on how to best migrate reports from their Bex Web portal into SAC and to manage the user adoption of the new reporting tool.

"It was a great pleasure to get support and guidance from Innologic throughout the project, and it helped to smoothen the transition and prepare the new SAC platform properly for the end-users"

Ninna Jacobsen
Project Manager, Vestas

SOLUTION

Innologic facilitated a seamless migration of existing queries, preserving data integrity and enhancing user experience in the new SAC environment.

The project focused on addressing performance issues and optimizing system efficiency by collaborating closely with stakeholders to tailor SAC to Vestas' specific needs. Training sessions were provided to empower users with essential skills for effective data analysis as well as a monitoring system to ensure user adaptation.

The migration to the modern SAC environment not only preserves their data, but also improves accessibility and enables more advanced analytics, ultimately driving better business outcomes.

"It has been a pleasure to be able to assist Vestas in their transition from using a soon to be outdated legacy system to SAC"

David Westergaard
CEO, Innologic
