

Case Study for Education Sector

CASB Solution for the Education Sector

Introduction

Based in Asia, a private business school that offers a broad range of long and short term programs in Business and Management had adopted G Suite. G Suite helped this school in achieving smoother operations, better coordination between its students, professors and others in the organization across all its campuses. In addition to having one synchronous platform for all the users, this institution also wanted the platform to resonate with its brand, so as to exude unity throughout the system.

Challenges with GSuite

Being a reputed business school with multiple campuses, it had become vital for this institute to build a unified image among all its users like students, professors, new admissions, applicants, etc., that would help instill a feeling of oneness throughout the institute, thus promoting a better user experience - internally and externally.

Given its adoption of G Suite, the institute wanted a solution that could enable them to brand the platform, along with keeping its Active Directory as it is.

CloudCodes for G Suite As A Solution

While evaluating solutions, this institute came across the Value Add On features of **CloudCodes for G Suite** (formerly known as gControl). After a few trials, CloudCodes for G Suite was adopted and applied to the entire system at this institute. With the 'Customized Login Page' feature of our solution the institute succeeded in establishing a uniform brand, Institute Name, Logo and Website address, throughout its G Suite without having to compromise on any of the other setups that they possessed, including the Microsoft Active Directory integration.

Additionally, the **IP Restriction** policies of CloudCodes for G Suite, helped the institute easily detect and eliminate phishing attacks, that otherwise would have led to data breach, which could have resulted in a great loss in its reputation and trust.

With CloudCodes for G Suite, the institute can now selectively apply policies to all its users or a set of users or department (OU) as per its requirement.

Profile

Industry:

Education

Geography:

Asia

Problem:

Difficulty on the login page after cloud migration
Same login page for personal mail and corporate mail

Solutions:

Customized login page for their website

Benefits:

Secures critical data of students or teachers
Same credentials for the school login page and windows login page

Quote -

"Education sector is one of the most important domains in the success of any country. With the adaptations in technology, we need to imbibe the latest technology used into our systems so that our children do not lag behind in any possible way. With the growing popularity of cloud working environment, we too employed cloud working models into our institute's work systems. This initially gave us the necessary thrust and is still giving, but we cannot rule out the pitfalls of going via this approach, which lies in the exposure of critical data unintentionally due to students or teachers free data access. We faced many data security challenges, mainly about the login page as G suite gives same login page both for the Personal Gmail and also for the corporate Gmail as well, but we wanted our school branding on the login page, so we deployed CloudCodes CASB solution, which was customized to provide us with this custom login page."
