

# PAM Automation saved time and reduced errors dramatically for ROI

## Summary

Safeguard provided better session management automation and ROI for PAM

Country

Industry

# Challenges

Human error in privilege management has been a huge challenge for our company, as many of our developers and privileged users are still learning and tend to make mistakes. One Identity Safeguard points out the human errors and mistakes, helping us avoid major issues and increase our ecosystem security.

“

The affordability of One Identity Safeguard has allowed us to allocate budget elsewhere, particularly towards integrating it with OneLogin, which helps us manage our increasing user base's needs and costs.

”

# Solutions

We use Safeguard for PAM, and we heavily rely on the session management and vault system features. In my experience, the best features Safeguard offers are related to session management, which are highly automated and make a lot of sense.

# Benefits

Excellent session management

Automation of PAM

Affordability

# The Story

Our main use case for One Identity Safeguard is access management and session management for our privileged users. "We have seen a 12% ROI with Safeguard, and we have saved a significant amount of money. When we were using CyberArk, it was very costly, and One Identity Safeguard is a much cheaper in the long run."
