

Rewiring the way work gets done by energizing process change with SAP Signavio solutions

Before: Challenges and opportunities

- Unwritten institutional expertise creating onboarding delays and hiding inefficiencies across teams
- Fragmented global processes resulting in 31 redundant variants and regional customizations
- Entrenched cultural habits resisting change and making dense, inconsistent documentation
- Urgent need for a unified process foundation to boost visual clarity and cross-functional alignment

Why SAP

- SAP Signavio Process Modeler solution to centralize and visualize processes, transform undocumented knowledge into reusable maps, drive global standardization, and align IT with business needs
- Various SAP Signavio solutions to apply process mining, simulation, and analytics that turn process maps into actionable insights, fueling adoption, scalability, and continuous improvement
- ArchiMate modeling through SAP Signavio to document enterprise architectures in a standardized playbook, linking diagrams with process maps and aligning business goals with system design

After: Value-driven results

- Cultural shift toward standardization, shared ownership, and greater openness to change
- Higher efficiency through faster implementations, streamlined onboarding, and fewer redundancies
- Expanding cross-functional community of modelers, champions, and collaborators
- Future-ready foundation for data-driven decision-making, enabled by process mining, simulation, and continuous improvement

“Using SAP Signavio solutions, we created capability maps linked to process models and architectural diagrams. This helped ensure a **shared understanding** of the system’s structure, its inputs and outputs, and how different components are connected.”

Chris Lore, Enterprise Architect, ERP and Process Excellence, Eaton Corporation plc
