

Object Shaper is a development company specializing in Windows 8, Windows Phone 8, and ASP.NET applications. Their latest development, MoBu, is a personal finance application that allows you to not only track your expenses and income, but also to fully analyze your finances.

The Challenge

Object Shaper set out to create an application that is intuitive and easy for customers to use. Some of their goals for the application included:

- ★ Seamless integration of code across several application platforms.
- ★ Attractive and functional charts.
- ★ The ability to export Excel files.

The Solution

Essential Studio provided Object Shaper with more than 400 controls and Syncfusion's technical support allowed them to get immediate assistance and complete their project quickly. The developers at Object Shaper found the Excel file manipulation controls and chart functions were an integral part of creating their product. The WPF platform allowed them to load and save application translations from Excel files, as well as introduce Excel export.

These functionalities within the application allow users to create analyses and reporting charts and tables and export the files on their budgets, expenditures, asset management, savings, and more.

The Results

Syncfusion's components and controls enabled Object Shaper to use the same code for their charts on both the Windows 8 and Windows Phone 8 applications, saving time and expenses.

The Windows 8 application for MoBu is available in the Windows Store now. Upcoming plans include releasing Windows Phone 8 app as well as developing MoBu applications for the iPad and iPhone with a .NET abstraction for iOS.
